Message from Chief Executive Officer MATRADE

Blessed with fertile land and favourable climate, Malaysia's agriculture industry continues to grow and with it, presents a rich agro-biomass resource. The biomass industry of Malaysia comprises several different industries brought together by the utilisation of renewable organic matters including timber waste, oil palm waste, paddy waste, coconut trunk fibre, sugarcane waste, kenaf fibre and many others.

The palm oil industry of Malaysia is the fourth largest contributor to the country's gross national income, accounting for about 8% or equivalent to RM50 billion annually. The industry is also the largest producer of biomass, with virtually every part of the tree useful in the creation of products ranging from plywood to biofuels.

It is because of the group opportunities in this sector that Malaysia Exporters of Biomass and Related Services Directory is published to serve as a sourcing guide for the foreign buyers. I believe this Directory will be a useful reference business contacts with Malaysian companies offering biomass products and services for the industry.

Thank you.

A handwritten signature in black ink, appearing to read "Wong Lai Sum".

DR WONG LAI SUM
Chief Executive Officer
MATRADE

Message from Chief Executive Officer POIC Sabah Sdn Bhd

The packaging of information is vital for a fast growing sector like biomass. It enables players and consumers alike to have a better grasp of the industry, knowing what are available and who are making them available. Such a birds-eye view of the biomass sector helps bring buyers and sellers together, helping in their planning and strategising.

The dynamic potentials of biomass, especially oil palm biomass, are only beginning to be understood and recognised. Malaysia is expected to produce about 100 million tons of oil palm biomass per year by 2020. National initiatives, in partnership with the private sector within and outside the country, aim to optimise the revenue potentials from biomass. These make for exciting times for the biomass sector in Malaysia, more so in Sabah which accounts for a third of national oil palm acreage.

The national ambition is to triple revenue by 2020 from the RM81 billion in 2011. Therefore, efforts such as this directory will have a significant impact in creating awareness and facilitate networking.

Thank you.

A handwritten signature in black ink, appearing to read "Pang Teck Wai".

DATUK DR PANG TECK WAI
Chief Executive Officer
POIC Sabah Sdn Bhd

Industry Overview

The agriculture sector in Malaysia generates about 11% of Gross National Income (GNI). In the process of creating this value, a significant amount of biomass is generated every year across a variety of crops, including but not limited to palm oil, rubber and rice.

Within this sector, by far the largest contributor to GNI is the palm oil, contributing about 8% or almost RM50 billion to the national income. The palm oil sector correspondingly generates the largest amount of biomass, estimated at 80 million dry tonnes of 'woody' biomass in 2010. This is expected to increase to about 100 million dry tonnes by 2020, primarily driven by increases in yield. As a result, the National Biomass Strategy 2020 (NBS 2020) was launched in November 2011 with a focus on oil palm biomass as a starting point, which is being extended to include biomass from other sources like forestry, other agricultural by-products and municipal waste.

The vast majority of the oil palm biomass generated today is returned to the field to release its nutrients and replenish the soil. The biomass returned to the field as organic fertiliser plays an important role to ensure the sustainability of fresh fruit bunch (FFB) yields. However

there is also the potential to utilise (portions of) this biomass for a variety of additional higher value uses, including but not limited to the production of wood products, energy pellets, bioenergy, biofuels (i.e. ethanol) and biobased chemicals (i.e. succinic acids and lactic acids). Due care and consideration are made to balance the amount of biomass that is left in the field for its nutrient value versus that utilised for higher value-added uses.

While the opportunities are immense, the different uses have very different risk-return profiles, given the differences in technological maturities, global demand potential and its competitive dynamics. Not surprisingly, the highest-value opportunities – biofuels and biobased chemicals – carry also the highest technology uncertainty and competitive risk.

Malaysia's NBS 2020 promotes the critical importance and significance of having a portfolio approach for Malaysian biomass producers and the nation at large, to ensure there is a combination of short to medium-term investments into immediate opportunities and longer-term investment in higher value-added opportunities for all Malaysian biomass owners.

Industry Overview

A conservative scenario of utilising an additional 20 million tonnes of oil palm biomass by 2020 for higher-value uses has the potential to contribute significantly to the nation's economy. In addition to a significant incremental contribution to GNI of RM30 billion by 2020, the National Biomass Strategy 2020 offers Malaysia a way to meet its renewable energy target, reduce emissions and create about 66,000 incremental jobs. This strategy also offers an opportunity for Malaysia to build several biofuel and biobased chemical downstream clusters to ensure the nation benefits from the downstream value creation potential.

From a supply-side perspective, by 2020 Malaysia's palm oil industry is expected to generate about 100 million dry tonnes of solid biomass. This includes not only the empty fruit bunches (EFB), mesocarp fibres (MF) and palm kernel shells (PKS), but also the oil palm fronds and trunks. Excluded from this figure is palm oil mill effluent (POME). On current course, most of this solid biomass will remain in the plantations as fertiliser, with a small but increasing amount being utilised for bioenergy given the introduction of a renewable energy feed-in-tariff system.

Biomass should not be removed from the field without consideration of its nutrient value and protection to the top-soil. However there is the potential to retain in the field the portion of the biomass that has the highest nutrient value but the lowest downstream value, as represented

by its carbohydrate content, and replace the balance with inorganic substitutes.

Moreover, converting the mostly unused POME into biogas for either powering the mills or selling power into the national grid would contribute towards the renewable energy target of Malaysia – 410 MW of installed biogas capacity by 2030.

This initiative alone would reduce the nation's carbon dioxide (CO₂) emissions by 12% and free up significant biomass for higher value-added uses. Taken in combination, this has the potential to free up 20% - 30% of the available solid biomass for higher value-added uses without affecting palm oil yields. This of course must be an industry led decision of each palm oil mill, based on its long-term commercial and sustainability merits.

Assessing the various costs of mobilising oil palm biomass today – harvesting, collection, pre-processing, substitution and transportation to a downstream hub – on the order of 25 million tonnes of biomass can be mobilised at globally competitive costs, i.e., at a cost of less than RM250 per dry-weight tonne. On current course (i.e., business as usual) approximately 12 million tonnes of solid biomass will likely be utilised for non-fertiliser uses by 2020, primarily

Industry Overview

for wood products and bioenergy. An additional 20 million tonnes could be mobilised for additional uses such as pellets, biofuels and biobased chemical industries. In total, this is approximately 30% of the solid biomass the palm oil industry is expected to generate annually by 2020.

In order to achieve the targets of the NBS 2020, creating various new high-value biomass industries for the industry and the nation, pellets would be a natural point of entry to start mobilising the industry, as the technology is reasonably mature, the cost of developing infrastructure relatively low (i.e., RM30 - 40 million per plant with a capacity of 100,000 tonnes) and the payback of 3 - 5 years relatively

quick, coincidentally long-term contracts for pellets also range from 3 - 5 years. Hence, while pellets enable profitable mobilisation today, they also act as a buffer. Should higher value biobased chemicals materialise earlier or should Malaysia capture a bigger share of the global biobased chemicals market, biomass can be diverted from pellets to capture these higher value opportunities.

Business-as-usual uses of biomass for wood products, bioenergy and pellets provide an opportunity to generate value from biomass today, with the potential to generate revenue of RM200 - 1,000 per dry tonne of solid biomass input. In parallel, resources should be expended to invest in longer-term projects around biofuels and biobased chemicals. These have higher risk and are expected to reach commercial scale only in the 2015 - 2020 timeframe, however have the potential for significantly higher value creation – on the order of RM1,000 - 3,000 of revenue per dry tonne of solid biomass input. A year since the launch of NBS 2020, technology for biobased chemicals has seen significant acceleration with the first commercial scale biobased chemical plants completed late 2012 and operational in 2013, making the opportunity a closer reality for Malaysia.

The biggest long-term opportunity for Malaysia remains in the space of biobased chemicals, with a forecasted global market size of RM110 - 175 billion by 2020. A critical success factor will be the mobilisation of biomass, both with regards to volumes, logistics – how to move it efficiently from plantations to centres of production – and cost – to ensure globally competitive costs compared to other biomass. While larger plantations will be able to participate in this opportunity given their individual scale, there is still merit in the use of partnerships to reduce risk. And it will be critical to create best-practice partnership structures to enable

Industry Overview

smaller plantations and small holders to participate.

As the world's second largest producer and largest exporter of palm oil, this is a natural opportunity for Malaysia to capture, with a significant prize. However achieving full potential will require significant coordination and cooperation among multiple stakeholders. The development of partnerships and partnership structures between plantation and mill owners is critical to mobilise the biomass, and initiatives under the Palm Oil National Key Economic Area (NKEA) are being used to accelerate this opportunity.

A new business opportunity has already been defined for pelletisation capacity. The launch of an industry consortium Oil Palm Biomass Centre (OPBC) to catalyse development and scaling up of conversion technologies will accelerate the research and development complementing the growth of the biomass industry. In addition, an existing Entry Point Project (EPP) has been expanded in scope for direct joint-ventures (JVs) between biomass owners and downstream technology or chemical companies.

Since the launch of NBS 2020 in 2011, initiatives such as MYBiomass (a joint-venture (JV) between Sime Darby, Federal Land Development Authority (FELDA) and Malaysian Industry - Government Group for High Technology (MiGHT) to aggregate their biomass), the first batch of commercial scale biomass pelletisation plants, completion of multiple government - industry led international roadshows to showcase commercialisation opportunities globally, visits from international downstream chemical companies to Malaysian biomass owners, joint-venture (JV) cluster workshops and numerous invitations to speak at international conferences are all testaments of the government's focus in creating excitement and opportunities for the industry through continual interaction with the industry and academia. With acceleration of technology in higher value uses and constant support and facilitation from the government to industries, NBS 2020 and the resulting 1Malaysia Biomass Alternative Strategy Initiative (1MBAS) taskforce have become a platform to ensure that our nation's interest in creating incremental GNI, higher value industries and high value jobs from biomass becomes a reality.

GLOSSARY

GLOSSARY

ACTIVATED CARBON

Activated carbon is a processed form of carbon treated to be more porous.

AGRICULTURAL RESIDUE

Agricultural crop residues are the plant parts, primarily stalks and leaves, not removed from the fields with the primary food or fibre product.

ASH

Ash is the non-combustible residue remaining after combustion. For biomass combustion, the ash consists of mainly inorganic elemental oxides representing bulk mineral matter after carbon; oxygen, sulphur and water have been driven off during combustion.

BAGASSE

Residue remaining after extracting a sugar-containing juice from plants like sugarcane.

BIOBASED CHEMICALS

Chemicals that are derived from plant or animal feedstock are typically considered biobased chemicals.

BIOBASED MATERIAL

An organic material in which carbon is derived from a renewable resource via biological processes. Biobased material includes all plant and animal mass derived from carbon dioxide recently fixed via photosynthesis per definition of a renewable resource.

BIOCHAR

Biochar is a porous carbonaceous solid produced by the thermochemical conversion of organic materials in an oxygen-depleted atmosphere. Biochar production systems are generally classified as either pyrolysis or gasification.

BIOCOPOMPOSITES

Biocomposites materials such as biomass fibres are molded and bonded together with a natural or synthetic resin. Biocomposites are characterised by the fact that the petrochemical resin is replaced by a vegetable or animal resin, and/or the bolsters are replaced by natural fibre.

BIOFUELS

Solid, liquid or gaseous fuel that is derived from biomass or biological materials. Biomass that has been processed or converted in some way into a more convenient form, principally to increase energy density.

GLOSSARY

BIOGAS

A mixture of methane and carbon dioxide produced by anaerobic digestion, with small amounts of other gases. The methane is a flammable gas, chemically identical to the main constituent of natural gas, and can be used as a fuel for heat and/or electricity generation.

BIOMASS CONVERSION TECHNOLOGY

Three main biomass conversion technology platforms are being explored today: thermal, biological and chemical. These are the technologies to convert biomass into biofuels and biobased chemicals.

BIOLOGICAL CONVERSION

Biomass is treated by chemicals and enzymes to produce sugars, which are then fermented into the desired fuels or chemicals.

BIOMASS PELLETS

Biomass pellets are short cylindrical pieces produced through compressing pulverised dry biomass. Biomass pellets (energy pellets) are renewable, high quality, solid biofuel with the significant properties of high energy density, low moisture content and homogeneity in their size and shape. Biomass pellets are also used as animal bedding.

BIOPLASTICS

Bioplastics is used to define two different kinds of plastics. One plastic product is based on renewable resources, the focus being on the origin of the material being used. The second product is biodegradable and compostable plastics where the focus is on the compostability of the final product.

BIOREACTORS

A large stainless steel tank used to grow producer microorganisms in the industrial production of enzymes and other chemicals.

BIOREFINERY

A biorefinery is a facility that integrates biomass conversion processes and equipment to produce fuels, power and chemicals from biomass.

CHEMICAL COMPOSITION OF BIOMASS

The percentages of various chemical components such as lignin, holocellulose, α -cellulose, hemicellulose and ash present in several forms of oil palm biomass provide an indication on their strength during fibre processing and chemical pulping, and on their readiness to be converted into simpler sugars for use as chemicals or biofuels.

CHEMICAL CONVERSION

Biomass and sugars are treated using chemicals only in a variety of methods to produce fuels or chemicals.

GLOSSARY

COCONUT FIBRE

Coconut fibre or coir is obtained from the fibrous husk (mesocarp) of the coconut. Coconut fibre has high lignin content and thus a low cellulose content, as a result of which it is resilient, strong and highly durable.

COMBINE HEAT AND POWER (CHP)

A system in which the heat associated with electricity generation is also used for space heating or process heat. In this way the overall efficiency of the process in terms of the proportion of the energy in the biomass fuel that is made use of is increased considerably. Also known as co-generation.

DIRECT COMBUSTION

Refers to burning biomass directly in a furnace to produce heat and electricity. Steam produced from heat of combustion powers a turbine that turns a generator to produce electricity.

DRIED LONG FIBRE

Palm fibre is extracted from oil palm's vascular bundles in the empty fruit bunch (EFB). Technology can convert EFB to dried long fibre and short dried fibre. Dried long fibre has a length of 5 - 15cm with moisture content around 12 - 15% and oil content less than 1%.

DRIED SHORT FIBRE

The dried short fibre is less than 1cm in length with moisture content around 12 - 15% and oil content less than 1%. It can be processed into biomass pellets and used in wood plastic composites.

EMPTY FRUIT BUNCH (EFB)

EFB is oil palm biomass resulting from the palm-oil extraction and milling process. EFB is both very fibrous and wet. It is conveniently collected and available for exploitation at palm oil mills.

GLOSSARY

FERMENTATION

A biochemical reaction that breaks down complex organic molecules (such as carbohydrates) into simpler materials (such as ethanol, carbon dioxide and water). Bacteria or yeast can ferment sugars to ethanol.

FURFURAL

An aldehyde derivative of certain biomass conversion processes; used as a solvent.

GASIFICATION

The process by which carbonaceous fuel (any fossil or biomass fuel consisting of / or containing carbon) is converted to a useable gaseous product without complete combustion of the fuel.

GLUCOSE

A six-carbon fermentable sugar.

HEMICELLULOSE

Hemicelluloses are polysaccharides in plant cell walls. Unlike cellulose, hemicellulose consists of short, highly branched chains of sugars. In contrast to cellulose, which is a polymer of only glucose, hemicellulose is a polymer of five different sugars. Hemicelluloses include xylan, glucuronoxylan, arabinoxylan, glucomannan and xyloglucan.

HYDROLYSIS

A chemical reaction that releases sugars that are normally linked together in complex chains. In ethanol production, hydrolysis reactions are used to break down the cellulose and hemicelluloses in the biomass.

KENAF FIBRE

The fibres in kenaf are found in the bast (bark) and core (wood). The bast constitutes 40% of the plant. These bast fibres are long (2 - 6 mm) and slender. The cell wall is thick. The core is about 60 % of the plant. The core has thick but short (0.5 mm) and thin walled fibres. Kenaf is an annual or biennial herbaceous plant growing 1.5 - 3.5 m tall with a woody base. The stems are 1 - 2 cm in diameter.

LIGNIN

A complex polymer that serves as a component of wood and vascular plants, making them firm and rigid.

GLOSSARY

LIGNOCELLULOSIC BIOMASS

Refers to the main building blocks of plant matter: that is composed of lignin, cellulose and hemicelluloses. Second generation biomass conversion technologies are being developed to convert lignocellulosic biomass to biofuels and biobased chemicals.

MESOCARP FIBRE

Palm fruit is about 5cm in length and has an oval shape. It consists of yellowish red oily flesh mesocarp and single seed palm kernel nut. At crude palm oil mills, palm fruit is cook under hot steam and pressed for oil extraction, with mesocarp fibre and palm kernel nut as left over mass. The mesocarp fibre is then separated from palm kernel nut by cyclone separator. Mesocarp fibre is elongated cellulose with 30 - 50mm length.

MOISTURE CONTENT

The proportion of water in a sample of biomass, defined as the weight of water as a percentage of the weight of biomass. This can be defined on either a wet basis, as a percentage of the total (wet) weight of the sample, or a dry basis, as a percentage of the oven dry weight of biomass. Wet basis is usually used for fuel purposes.

OIL PALM BIOMASS

Six main types of oil palm biomass are produced as by-products of the palm oil industry: oil palm fronds, oil palm trunks, empty fruit bunch, palm kernel shells, mesocarp fibre and palm oil mill effluent. Oil is only 10% of the total dry matter of the oil palm with the remaining 90% being oil palm biomass.

OIL PALM FRONDS (OPF)

The oil palm fronds (OPF) are the leaves of the oil palm and are available during pruning and replanting activities. The oil palm frond is approximately 2-3 meters long and weighs about 10kg (wet weight). It consists of the petiole (the stem) and many long leaflets on either side of the stem. The top two thirds of the frond contain most of the nutrients, while the basal (lower) third is rich in cellulosic materials and sugars, which are needed in the production of biofuels and biobased chemicals.

GLOSSARY

OIL PALM LEAFLETS

Oil palm leaflets are on either side of the stem of the top and middle of the frond. These top two thirds of the oil palm frond contain most of the nutrients.

OIL PALM TRUNK (OPT)

Oil palm trunks become available at the end of a plantation's life cycle every 25 to 30 years. The bole length of felled palm trunk is in the range of 7 - 13m, with a diameter of 45cm - 65cm, measured at breast height. OPT has been utilized to replace wood. It has been used in plywood, veneer, MDF, furniture and flooring industries.

PALM KERNEL CAKE (PKC) / PALM KERNEL EXPELLER (PKE)

Palm kernel cake (PKC) or palm kernel expeller (PKE) is the remains after palm kernel oil is pressed out from the palm kernel nut of the palm fruit.

PALM KERNEL SHELL (PKS)

Palm kernel shells (PKS) remains after palm kernel oil extraction.

PALM OIL MILL EFFLUENT (POME)

The processing of fresh fruit bunches of oil palm results in the generation of different type of residues of which one is POME. POME comprises a combination of wastewater from three main sources via clarification (60 %), sterilization (36 %) and hydrocyclone (4%) units. It contains various suspended components including cell walls, organelles, short fibres, a spectrum of carbohydrates ranging from hemicelluloses to simple sugars, a range of nitrogenous compounds from proteins to amino acids, free organic acids and an assembly of minor organic and mineral constituents.

PYROLYSIS

Pyrolysis is a thermo-chemical conversion process whereby biomass is heated at high temperatures in the complete absence of an oxidant (oxygen). Products for this process include combustible gas, liquid condensates and charcoal. The liquid portion is called pyrolysis oil, which can be burned to generate electrical power. It can also be used as a chemical additive to produce plastics and other bio-products.

GLOSSARY

STARCH

Starch is a carbohydrate consisting of large number of glucose units joined by glycosidic bonds. This polysaccharide is produced by all green plant as an energy store. Starch is a carbohydrate consisting of large number of glucose units joined by glycosidic bonds. This polysaccharide is produced by all green plant as an energy store.

STOVER

The dried stalks and leaves of a crop remaining after the grain have been harvested.

SYNTHESIS GAS

A mixture of carbon monoxide and hydrogen which is the product of high temperature gasification of organic material such as biomass. Following clean-up to remove any impurities such as tars, synthesis gas (syngas) can be used to synthesize organic molecules such as synthetic natural gas (SNG - methane or liquid biofuels such as synthetic diesel (via Fischer-Tropsch synthesis).

THERMAL CONVERSION

Biomass is first broken down into syngas using heat and low oxygen concentrations. Subsequently, a range of thermo-chemical processes can be applied to generate fuels or chemicals.

XYLAN

Xylan is polysaccharides made from unit of xylose. It is a polymer of xylose with a repeating unit of CHO (chemical formula Carbon Hydrogen Oxygen), found in the hemicelluloses fraction of biomass.

XYLOSE

Xylose is classified as a monosaccharide of aldopentose type that contains five carbons. Xylose is the main building block for hemicelluloses which comprises about 30% of plant matter.

MATRADE SERVICES

MATRADE SERVICES

Malaysia External Trade Development Corporation (MATRADE), was established in March 1993 as a statutory agency under the Ministry of International Trade Industry (MITI).

As Malaysia's national export promotion agency, MATRADE is responsible for assisting Malaysian companies succeed in the international market. MATRADE's vision of making Malaysia the premier exporting nation is paired with its mission to develop and promote Malaysia's exports to the world.

MATRADE serves to promote Malaysia's external trade with particular emphasis on the export of manufactured and semi-manufactured products and services. In addition, MATRADE formulates and implements export marketing strategies and trade promotion activities to increase Malaysia's exports, undertake market research, and create a comprehensive database of information for the development and improvement of Malaysia's trade. MATRADE also organizes training programs to enhance the international marketing skills of Malaysian exporters, promote and assist in services related to trade, and protect Malaysia's international trade interest abroad.

MATRADE's objectives are:

- To raise the profile of Malaysian exporters in foreign markets;
- To disseminate timely and relevant information and market intelligence to help Malaysian companies gain a competitive edge in foreign markets;

- To introduce Malaysian companies to foreign importers seeking Malaysian suppliers; and
- To undertake activities to promote the export of Malaysian goods and services in overseas markets.

MATRADE is also actively involved in assisting foreign companies to source for suppliers of Malaysian products and services, and is represented worldwide at over 40 locations in major commercial cities. In Malaysia, MATRADE has five local branches in Penang, Terengganu, Johor, Sabah, and Sarawak.

MATRADE SERVICES

MATRADE's mission is to develop and promote Malaysia's export to the world and its functions are:

- To promote, assist and develop Malaysia's external trade with particular emphasis on the export of manufactured and semi-manufactured products and, on a selective basis, imports;
 - To formulate and implement a national export marketing strategy to promote the export of manufactured and semi-manufactured products;
 - To undertake commercial intelligence and market research and create a comprehensive database of information for the improvement and development of trade;
 - To organise training programmes to improve the international marketing skills of the Malaysian exporters;
 - To enhance and protect Malaysia's international trade interests abroad;
 - To represent Malaysia in any international forum in respect of any matter relating to trade;
 - To develop, promote, facilitate and assist in service areas related to trade; and
 - To advise the Government on matters affecting or in any way connected with trade and to act as the agent of the Government or for any person, body or organisation on such matters
- International Trade Fairs, Promotion Booths, Malaysian Product Exhibitions and In-Store Promotions;
- Exhibition Centres (Domestic and International);
 - Business Matching following Trade Enquiries;
 - Incoming Buying Missions;
 - Incoming Trade Delegations;
 - Seminars and workshops.

Malaysian exporters or export ready companies are welcome to become MATRADE member by registering online or by submitting their Malaysia Exporters Registry brochure to the Trade Advisory Services Unit. Registration with MATRADE is free. MATRADE can be contacted at:

Malaysia External Trade Development Corporation (MATRADE)
Level 2, Menara MATRADE
Jalan Khidmat Usaha
Off Jalan Duta
50480 Kuala Lumpur

Tel : 603-62077077

Among the services provided by MATRADE are:

- MATRADE Business Information Centre;
- Electronic Publications;
- Market Information;
- Organising Overseas Trade Missions, Specialised Marketing Missions,

**POIC SABAH
SDN BHD**

POIC SABAH SDN BHD

The Sabah state government in 2005 initiated the development of palm oil industrial clusters to spearhead downstream palm oil processing to add value, to create jobs and new wealth. Since then, interests and investments have expanded not only into palm oil-based downstream industries but also in the utilisation of oil palm biomass.

It is estimated that oil palm plantations in Malaysia produce 80 million tons of biomass per year. Although numerous home grown and foreign technologies have made it to utilise the biomass for a variety of products such as pellets, fertilisers, animal feed, energy etc development lacked pace because of uncertain feedstock availability.

Studies have shown that the east coast of Sabah is ideal for biomass development because of the concentration of plantations and mills. POIC Lahad Datu is located at Lahad Datu, in the heart of Sabah's oil palm growing area.

POIC Lahad Datu started Sabah's palm oil downstream revolution. It began with 1,150 acres in an area adjacent to an existing cluster of oil palm refineries, and enjoying a natural harbor with depths of up to 20 meters. This enables vessel of up to 100,000 dwt to call at the liquid terminal.

Government support enabled rapid development of POIC Lahad Datu. The cluster, which has 41 investors with a combined investment of RM4.5 billion (as of June 2012) has completed a

five-berth liquid bulk terminal, a dry bulk jetty with two quay cranes and a conveyor belt system (catering to a fertiliser cluster with nine plants in various stages of completion) and a comprehensive pipe rack system.

A RM490 million container terminal has been approved for construction. A LNG re-gasification terminal and a 300MW gas-fired power plant are being planned for POIC Lahad Datu with completion from 2015. These enhance POIC Lahad Datu's readiness and competitiveness to be a hub for regional oil palm-related industries as well as a logistics hub for the region of BIMP-EAGA, or Brunei-Indonesia-Malaysia-Philippines East ASEAN Growth Area, covering the sultanate of Brunei Darussalam, the territories of Sabah, Sarawak in Malaysia, Mindanao in the Philippines, Kalimantan, Sulawesi, and Irian Jaya in Indonesia. BIMP-EAGA has a population of 60 million and is rich in natural resources. The geographical location, regional dynamics, raw materials availability and superior logistics infrastructure give Lahad Datu a distinct all-round advantage for investors.

ADVERTISERS

YOUR GLOBAL INVESTMENT HUB

POIC is located near the township of Lahad Datu in southeastern Sabah. It is at the centre of the state's 1.3 million hectares of oil palm plantations. The first two phases covering 1,150 acres focus on major palm oil industries such as refineries, biodiesel plants, cleochemicals, biomass and critical support industries such as a central steam provider, bulking installations and dedicated jetties. In the next phase covering about 3,300 acres, a broader based cluster is planned to encompass energy intensive sectors, cocoa, ship repairs and construction, food, marine, furniture and machinery sectors. A halal hub comprising 1,000 acres is also targeted to capture the sizable global halal market.

MASTER JAYA

Air Pollution Control Turnkey Solution Provider for Biomass Industry and All Manufacturing & Process Industries

We design, manufacture, install, commission, supply and service equipment and system for Air Pollution Control & Local Exhaust Ventilation

Company Background :

MASTER JAYA – established since 1983, is a reliable and responsible Engineering, Contracting, Consulting, Manufacturing, Sales & Service company Specialized in the field of Industrial Air Pollution Control, Gas and Rume Clearing System, Odour Control, Noise Control & Industrial Stencers, Industrial Ventilation, Fans & Blower System, Pneumatic Conveying & Powder Processing & Handling, Storage Silo & Discharge System, Steel Mill Equipment and all steel fabricated products, equipment & machinery.

Project Track Record :

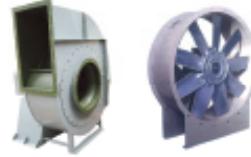

We have had more than 28 years of proven practical experience, know-how and successful track record of designing, manufacturing, installing & commissioning several hundreds air pollution control & Industrial ventilation installations all over Malaysia & ASEAN Countries in almost all process and manufacturing industries.

Needlefelt Filter bags & Pleated Spun Bonded Filter

Materials: Polyester, Nomex, Polypropylene, Teflon, PTFE, PVF, Ceramic & Others

Sealant Treatment: Oil & Water Repellant, PTFE Coating & Membrane, Araldite & others

Industrial Centrifugal & Axial Flow Fans for Ventilation, Pneumatic Conveying, air pollution control, drying, combustion and powder handling
Materials: In mild steel, galvanized steel, stainless steel, plastic & PTFE.
Capacity: up to 1,800,000 m³/h and pressure up to 30 000 Pa.

Air Pollution Control Systems

ISO 9001:2008

**Quality Management Systems
Certified Company**

Vertical Packed Tower Gas Scrubbers

Applications: Gaseous pollutants, VOC Removal, odour control, acidic & alkaline gases

Capacity: 1,000 to 30,000 m³/h

Materials: PTFE, Plastic, Stainless Steel

Vertical Scrubber & Wet Duct Collector
Applications: Fine Wet Dust, Wet, Hot, Dry Dust & Fumes
Capacity: 1,000 m³/h up to 300,000 m³/h
Materials: Stainless Steel

Fabric Filter Pulse-Jet Dust Collectors
Applications: Fine dust & fumes from various industries & processes

Filter area: 20 to 30,000 m²

Filter materials: Polyester, Nomex, Polypropylene, Teflon, PTFE, Ceramic, PVF, etc.

Materials: Mild Steel, Galvanized Steel, Stainless Steel

Activated Carbon Filter & Columns for Odour & VOC Control & Solvent Recovery

Thermal Oxidizer, Reactor, Regenerator & Catalyst for Odour, VOC & Solvent Removal
